

## Installation of Apache OpenMeetings 4.0.0 on Debian 8

This tutorial is made based on fresh installations of

**debian-8.6.0-amd64-CD-1.iso**

It is tested with positive result. We will use the Apache's binary version OpenMeetings 4.0.0 stable, that is to say will suppress his compilation. It is done step by step.

5-11-2017

Starting...

1)

First update and upgrade the OS:

[apt-get update](#)

[apt-get upgrade](#)

2)

### ----- Installation of Oracle Java 1.8 -----

OpenMeetings 4.0.0 need Java 1.8 to work. Add repository to install Oracle Java 1.8.

(Only one line with space between both)

```
echo "deb http://ppa.launchpad.net/webupd8team/java/ubuntu trusty main" | tee /etc/apt/sources.list.d/webupd8team-java.list
```

```
echo "deb-src http://ppa.launchpad.net/webupd8team/java/ubuntu trusty main" | tee -a /etc/apt/sources.list.d/webupd8team-java.list
```

```
apt-key adv --keyserver hkp://keyserver.ubuntu.com:80 --recv-keys EEA14886
```

```
apt-get update
```

To accept the license automatically when install it:

(Only one line without space between both)

```
echo oracle-java8-installer shared/accepted-oracle-license-v1-1 select true | sudo /usr/bin/debconf-set-selections
```

...now install Oracle Java:

```
apt-get install oracle-java8-installer
```

Maybe you have installed various versions of Java. We select the just installed Oracle Java:

```
update-alternatives --config java
```

To know the active java version:

```
java -version
```

3)

#### ----- Installation of LibreOffice -----

LibreOffice is need it to convert to pdf the uploaded files.

```
apt-get install libreoffice
```

4)

#### -----Installation ImageMagick y Sox -----

**ImageMagic**, work the image files jpg, png, gif, etc. Will install it and some paquets and libraries:

```
apt-get install imagemagick libgif4 libgif-dev zlib1g-dev liboil0.3 unzip make
```

```
apt-get install build-essential libfreetype6-dev wget
```

**Sox**, work the audio. Will compile.

```
cd /opt
```

```
wget http://sourceforge.net/projects/sox/files/sox/14.4.2/sox-14.4.2.tar.gz
```

```
tar xzvf sox-14.4.2.tar.gz
```

```
cd /opt/sox-14.4.2
```

```
./configure
```

```
make && make install
```

```
cd /opt
```

5)

**----- Installation of Adobe Flash Player -----**

OpenMeetings even need Adobe Flash Player for cam.

Add repository to can install it:

```
gedit /etc/apt/sources.list
```

...copy-paste these two lines and comment: # deb cdrom:[Debian GNU/Linux 8 \_Jessie\_ ...

```
deb http://ftp.us.debian.org/debian jessie contrib non-free  
deb http://ftp.us.debian.org/debian jessie contrib
```

...save, update:

```
apt-get update
```

...and install:

```
apt-get install flashplugin-nonfree
```

6)

**----- Compilation of FFmpeg -----**

**FFmpeg** will work the video.

This compilation is based on:

<https://trac.ffmpeg.org/wiki/CompilationGuide/Ubuntu>

Updated to 5-11-2017. Install libraries:

(Only one line with space between each one)

```
apt-get -y --force-yes install autoconf automake libass-dev libfreetype6-dev  
libgpac-dev libSDL1.2-dev libtheora-dev libtool libva-dev libvdpau-dev libvorbis-dev libxcb1-dev  
libxcb-shm0-dev libxcb-xfixes0-dev pkg-config texi2html zlib1g-dev nasm libx264-dev cmake  
mercurial libopus-dev curl git
```

I made a script that will download, compile and install ffmpeg. It is tested and works rightly.  
The result of any recording we do in OpenMeetings, will be in mp4 format.

Please, download the script.

`cd /opt`

(Only one line without space between both)

`wget https://cwiki.apache.org/confluence/download/attachments/27838216/ffmpeg-ubuntu-debian.sh`

...concede permission of execution:

`chmod +x ffmpeg-ubuntu-debian.sh`

...and run it (be connected to Internet). The compilation will spend about 30 minutes:

`./ffmpeg-ubuntu-debian.sh`

When finish the compilation, a text will appear:

FFmpeg Compilation is Finished!

Then, please, go to **step 7).**

But if you prefer copy and paste (**i don't advise**), here leave the commands script:

`sudo gedit /opt/ffmpeg.sh`

...copy and past **from here**:

```
# FFmpeg compilation for Ubuntu and Debian.
```

```
# Alvaro Bustos. Thanks to Hunter.
```

```
# Updated 5-11-2017
```

```
sudo apt-get update
```

```
sudo apt-get -y --force-yes install autoconf automake build-essential libass-dev libfreetype6-dev  
libsdl1.2-dev libtheora-dev libtool libva-dev libvdpau-dev libvorbis-dev libxcb1-dev libxcb-shm0-  
dev libxcb-xfixes0-dev pkg-config texi2html zlib1g-dev mercurial cmake
```

```
# Create a directory for sources.
```

```
SOURCES=$(mkdir ~/ffmpeg_sources)
```

```
cd ~/ffmpeg_sources
```

```
# Download the necessary sources.
```

```
wget ftp://ftp.gnome.org/mirror/xbmc.org/build-deps/sources/lame-3.99.5.tar.gz
```

```
wget http://www.tortall.net/projects/yasm/releases/yasm-1.3.0.tar.gz
```

```
curl -#LO ftp://ftp.videolan.org/pub/x264/snapshots/last_stable_x264.tar.bz2
```

```
hg clone https://bitbucket.org/multicoreware/x265
```

```
wget -O fdk-aac.tar.gz https://github.com/mstorsjo/fdk-aac/tarball/master
```

```
wget https://sources.voidlinux.eu/opus-1.2.1/opus-1.2.1.tar.gz
```

```
git clone --depth 1 https://chromium.googlesource.com/webm/libvpx.git
```

```
# git clone --depth 1 git://source.ffmpeg.org/ffmpeg
```

```
wget http://ffmpeg.org/releases/ffmpeg-3.1.1.tar.gz
```

```
# Unpack files
for file in `ls ~/ffmpeg_sources/*.tar.*`; do
tar -xvf $file
done

cd yasm*/
./configure --prefix="$HOME/ffmpeg_build" --bindir="$HOME/bin" && make && sudo make
install && make distclean; cd ..

cd x264*/
PATH="$HOME/bin:$PATH" ./configure --prefix="$HOME/ffmpeg_build" --bindir="$HOME/bin"
--enable-static && PATH="$HOME/bin:$PATH" make && sudo make install && make distclean;
cd ..

cd x265/build/linux
PATH="$HOME/bin:$PATH" cmake -G "Unix Makefiles"
-DCMAKE_INSTALL_PREFIX="$HOME/ffmpeg_build" -DENABLE_SHARED:bool=off
..../source && make && sudo make install && make distclean; cd ~/ffmpeg_sources

cd mstorsjo-fdk-aac*/ autoreconf -fiv && ./configure --prefix="$HOME/ffmpeg_build" --disable-
shared && make && sudo make install && make distclean; cd ..

cd lame*/
./configure --prefix="$HOME/ffmpeg_build" --enable-nasm --disable-shared && make && sudo
make install && make distclean; cd ..

cd opus*/
./configure --prefix="$HOME/ffmpeg_build" --disable-shared && make && sudo make install &&
make distclean; cd ..

cd libvpx
PATH="$HOME/bin:$PATH" ./configure --prefix="$HOME/ffmpeg_build" --disable-examples
--disable-unit-tests && PATH="$HOME/bin:$PATH" make && sudo make install && make clean;
cd ..

cd ffmpeg*/
PATH="$HOME/bin:$PATH" PKG_CONFIG_PATH="$HOME/ffmpeg_build/lib/pkgconfig"
./configure --prefix="$HOME/ffmpeg_build" --pkg-config-flags="--static" --extra-cflags="-
I$HOME/ffmpeg_build/include" --extra-ldflags="-L$HOME/ffmpeg_build/lib"
--bindir="$HOME/bin" --enable-gpl --enable-libass --enable-libfdk-aac --enable-libfreetype
--enable-libmp3lame --enable-libopus --enable-libtheora --enable-libvorbis --enable-libvpx
--enable-libx264 --enable-libx265 --enable-nonfree && PATH="$HOME/bin:$PATH" make &&
sudo make install && make distclean && hash -r; cd ..

cd ~/bin
cp ffmpeg ffprobe ffplay ffserver vsyasm x264 yasm ytasm /usr/local/bin
```

```
cd ~/ffmpeg_build/bin  
cp lame x265 /usr/local/bin  
  
echo "FFmpeg Compilation is Finished!"
```

**...to here.**

Concede permission of execution:

```
chmod +x /opt/ffmpeg.sh
```

Now be connected to Internet, run the script and wait some long minutes while the compilation:

```
cd /opt
```

```
./ffmpeg.sh
```

All the compiled files will be installed in: /usr/local/bin

7)

**----- Installation and configuration of MariaDB data server -----**

MariaDB is the data server.

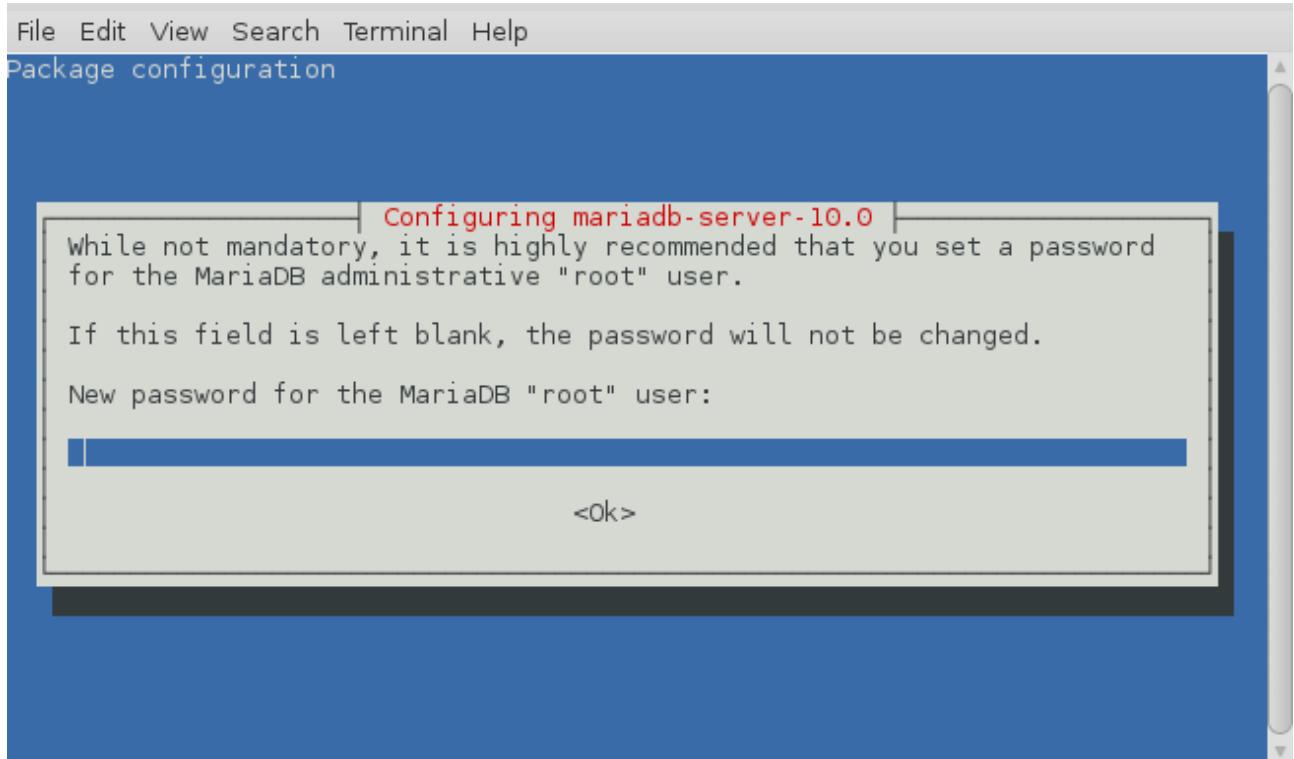

It is in Jessie repository. Install these packages:

```
sudo apt-get install python-software-properties software-properties-common
```

...and now MariaDB:

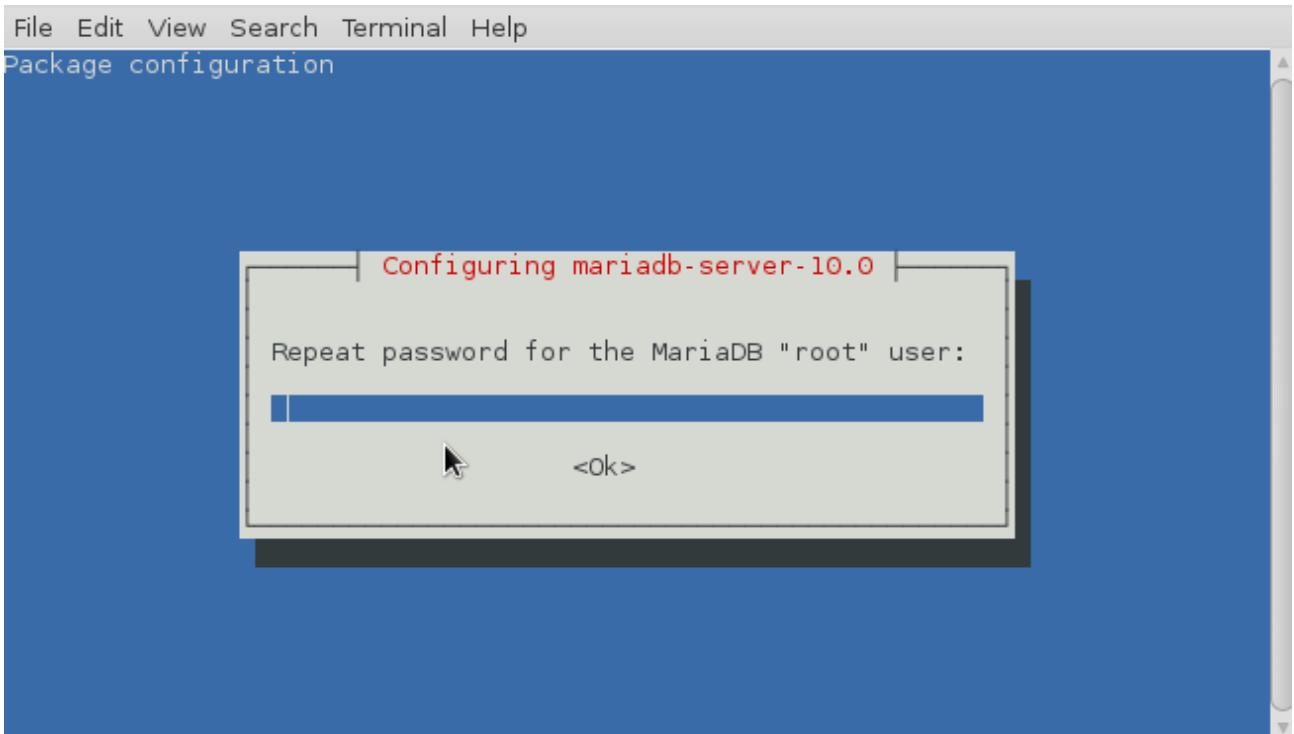

```
apt-get install mariadb-server
```

Will open a window asking for a root MariaDB password:

Type the password you like it → **Ok** → **Enter**

...will ask repeat the password:

Run MariaDB:

/etc/init.d/mysql start

Make a database for OpenMeetings. User password must be of 8 digits minimum:

**mysql -u root -p**

...will ask for the root password that we have just chosen, type it...

MariaDB [(none)]> **CREATE DATABASE open40 DEFAULT CHARACTER SET 'utf8';**

With this command we have created a database called open40.

Now we create a user with all permission on this database.

(Only one line with space between both)

MariaDB [(none)]> **GRANT ALL PRIVILEGES ON open40.\* TO 'hola'@'localhost' IDENTIFIED BY '1a2B3c4D' WITH GRANT OPTION;**

- \* **open40** .....is the database name.
- \* **hola** .....is the user name for this database.
- \* **1a2B3c4D** ...is the password of this user.

You can change the data...but remember it! Later we'll need it.

Now we leave MariaDB:

MariaDB [(none)]> **quit**

**8)**

### ----- Installation of OpenMeetings -----

We'll install OpenMeetings in /opt/red540. All the following information will be based on this directory.

Call to our folder of installation red540

Make the folder:

**mkdir /opt/red540**

**cd /opt/red540**

wget <http://apache.miloslavbrada.cz/openmeetings/4.0.0/bin/apache-openmeetings-4.0.0.zip>

unzip apache-openmeetings-4.0.0.zip

...save the unloaded file to /opt:

mv apache-openmeetings-4.0.0.zip /opt

Do to **nobody** owner of the whole OpenMeetings folder installation, for security:

chown -R nobody /opt/red540

Download and install the connector between OpenMeetings and MariaDB:

cd /opt

(Only one line without space between both)

wget <http://repo1.maven.org/maven2/mysql/mysql-connector-java/5.1.45/mysql-connector-java-5.1.45.jar>

...and copy it to where must be:

cp /opt/mysql-connector-java-5.1.45.jar /opt/red540/webapps/openmeetings/WEB-INF/lib

Now we are going to form OpenMeetings for our database in MariaDB:

gedit /opt/red540/webapps/openmeetings/WEB-INF/classes/META-INF/mysql\_persistence.xml

**Modify on line 72:**

, Url=jdbc:mysql://localhost:3306/openmeetings?

...to

, Url=jdbc:mysql://localhost:3306/**open40**?

...it is the name of the database that we did initially.

If you choose another name for the database, please type it here. Save the changes.

We protect the access to the file:

(Only one line without space between both)

```
chmod 640 /opt/red540/webapps/openmeetings/WEB-INF/classes/META-INF/mysql_persistence.xml
```

9)

----- Script to launch red5-OpenMeetings -----

Please, download the red5 run script:

```
cd /opt
```

```
wget https://cwiki.apache.org/confluence/download/attachments/27838216/red5-ubdeb2
```

...and copy it to:

```
cp red5-ubdeb2 /etc/init.d/
```

Concede permission of execution:

```
chmod +x /etc/init.d/red5-ubdeb2
```

If you made the installation in any other different path to /opt/red540, please edit the script and modify the line:

RED5\_HOME=/opt/red540

...to

RED5\_HOME=/your-path-installation

10)

----- Run red5-OpenMeetings -----

Start MariaDB if still it is not:

```
/etc/init.d/mysql start
```

...and now start red5-OpenMeetings:

```
/etc/init.d/red5-ubdeb2 start
```

...will appear two text lines in the shell:

```
start-stop-daemon: --start needs --exec or --startas
```

Try 'start-stop-daemon --help' for more information.

...you do nothing. Don't worry, everything work right.

Wait about 40 seconds minimum, in order that red5 it is running completely, and later can go to:

<http://localhost:5080/openmeetings/install>

...there will appear a page similar to this one:

The screenshot shows the first step of the OpenMeetings installation wizard. The title bar says "OpenMeetings". The main content area has a section titled "1. Enabling import of PDFs into whiteboard". It contains a bullet point: "Install GhostScript on the server, you can get more information on <http://pages.cs.wisc.edu/~ghost/> regarding installation. The instructions for installation can be found there, however on most linux systems you can get it via your favorite package managers (apt-get).". Below this is a bolded link "If you have further questions or need support in installation or hosting:". Underneath are two sections: "Community-Support:" with a link to "Mailing lists" and "Commercial-Support:" with a link to "Commercial-Support". At the bottom right are navigation buttons: '<', '>', '>>', and "Finish".

Push button (bottom), and will show the default database configuration with Derby, but we employ MySQL (MariaDB):

The screenshot shows the second step of the OpenMeetings installation wizard, titled "DB configuration". It has a section "Recommendation for production environment" stating: "By default OpenMeetings uses the integrated Apache Derby database. For production environment you should consider using MySQL, PostgreSQL, IBM DB2, MSSQL or Oracle". A yellow note box says: "NOTE Please use unpredictable DB login and 'strong' password with length 8 characters or more.". Below are fields: "Choose DB type" set to "Apache Derby", "Specify the name of the database" set to "openmeetings", and a "Check" button. At the bottom right are navigation buttons: '<', '>', '>>', and "Finish".

...then, scroll and **Choose DB type** to MySQL:

**OpenMeetings**

**DB configuration**

**Recommendation for production environment**

By default OpenMeetings uses the integrated Apache Derby database. For production environment you should consider using MySQL, PostgreSQL, IBM DB2, MSSQL or Oracle

**NOTE** Please use unpredictable DB login and 'strong' password with length 8 characters or more.

Choose DB type	MySQL
Specify DB host	localhost
Specify DB port	3306
Specify the name of the database	open40
Specify DB user	
Specify DB password	

**Check**

**<** **>** **>>** **Finish**

...and will show our data base configuration we made in step 8.

If you've choose any other different name for this, will show equally.

Now we must introduce the user name we did for our data base, at the step 8, and his password:

**Specify DB user** = **hola**

**Specify DB password** = **1a2B3c4D**

Please, push **>** button, and will go to:

**OpenMeetings**

**Userdata**

Username	
Userpass	
EMail	
User Time Zone	Europe/Madrid

**Group(Domains)**

Name	
------	--

**<** **>** **>>** **Finish**

Here, we must introduce a user name for OpenMeetings, and his password. This must have 8 digits minimum, and at least 1 special symbol like: + ( % # ! ...etc.

**Username** = a-name ...this user will be administrator.

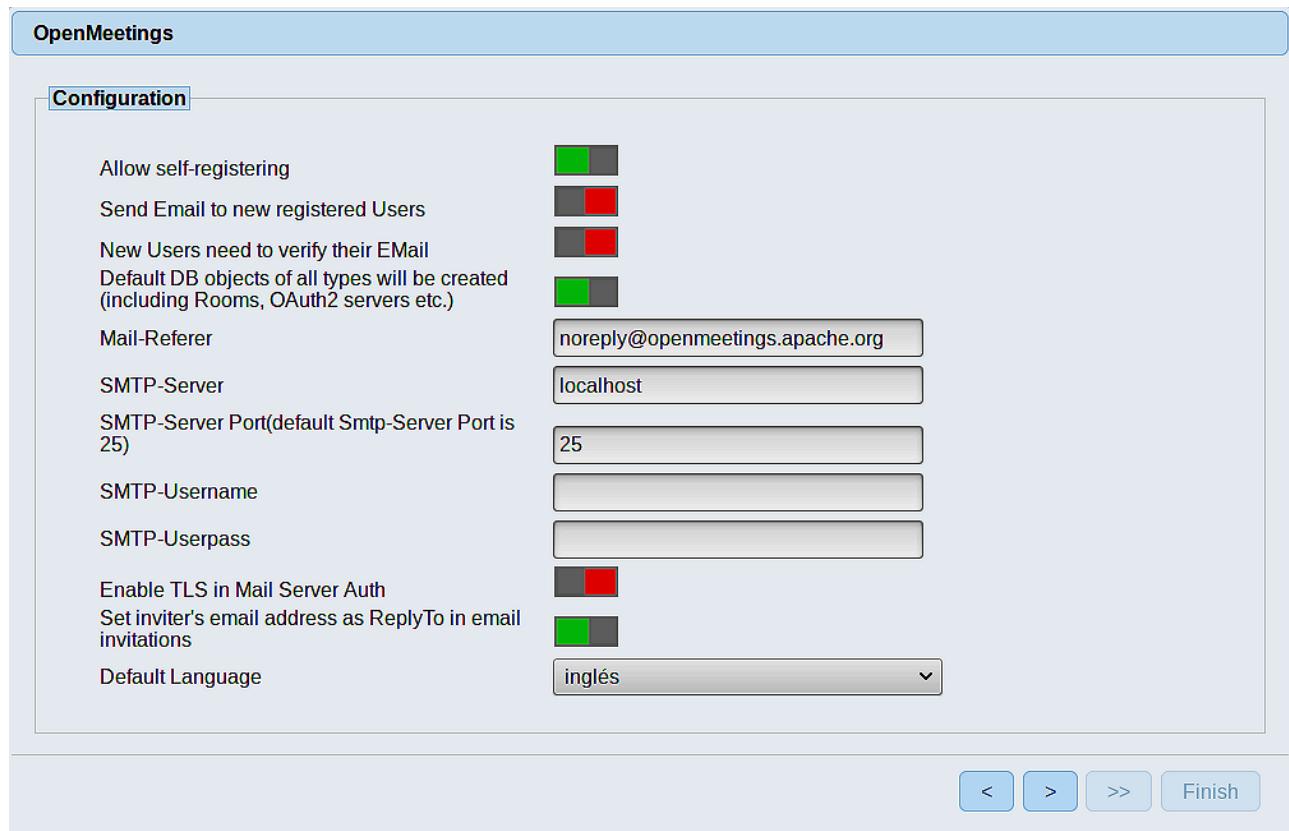

**Userpass** = a-password ...for the previous user.

**Email** = email-adress ...of the previous user.

**User Time Zone** = country where is this serve

**Name** = example-openmeetings ...group name to choose.

Press the button  and will lead us to a new page (below) where you can select the language for your OpenMeetings server, as well as other options such as the configuration of the mail server being used to send invitations or meetings from OpenMeetings:

The screenshot shows the 'Configuration' section of the OpenMeetings web interface. It includes the following settings:

- Allow self-registering: On (green)
- Send Email to new registered Users: Off (red)
- New Users need to verify their EMail: Off (red)
- Default DB objects of all types will be created (including Rooms, OAuth2 servers etc.): On (green)
- Mail-Referer: noreply@openmeetings.apache.org
- SMTP-Server: localhost
- SMTP-Server Port (default Smtp-Server Port is 25): 25
- SMTP-Username: (empty field)
- SMTP-Userpass: (empty field)
- Enable TLS in Mail Server Auth: Off (red)
- Set inviter's email address as ReplyTo in email invitations: On (green)
- Default Language: inglés

At the bottom right are navigation buttons: <, >, >>, and Finish.

A valid example to configure the mail server with Gmail, is as follows:  
(replace **john@gmail.com** with your real Gmail account)

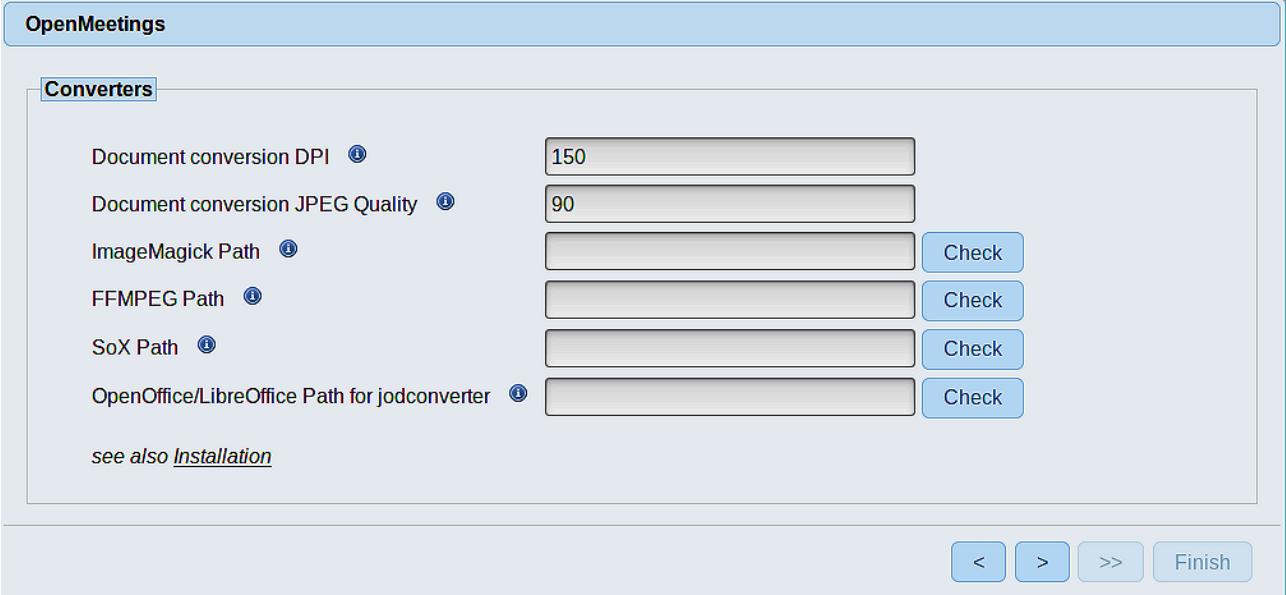

<b>Mail-Refer</b>	==	john@gmail.com
<b>SMTP-Server</b>	==	smtp.gmail.com
<b>SMTP-Server Port (default Smtip-Server Port is 25)</b>	==	587
<b>SMTP-Username</b>	==	john@gmail.com
<b>SMTP-Userpass</b>	==	password of john@gmail.com
<b>Enable TLS in Mail Server Auth</b>	==	...turn green the button to activate

To select the language of your server OpenMeetings, please scroll on the line:

<b>Default Language</b>	==	...select your language
-------------------------	----	-------------------------

...the rest you can modify it as you like.

Now press the button  and a new page will appear:

OpenMeetings

**Converters**

Document conversion DPI ⓘ	150	
Document conversion JPEG Quality ⓘ	90	
ImageMagick Path ⓘ	<input type="text"/>	Check
FFMPEG Path ⓘ	<input type="text"/>	Check
SoX Path ⓘ	<input type="text"/>	Check
OpenOffice/LibreOffice Path for jodconverter ⓘ	<input type="text"/>	Check

see also [Installation](#)

< > >> Finish

Here we'll introduce the respective paths for the image, video, audio and conversion of uploaded files:

**ImageMagick Path** == /usr/bin

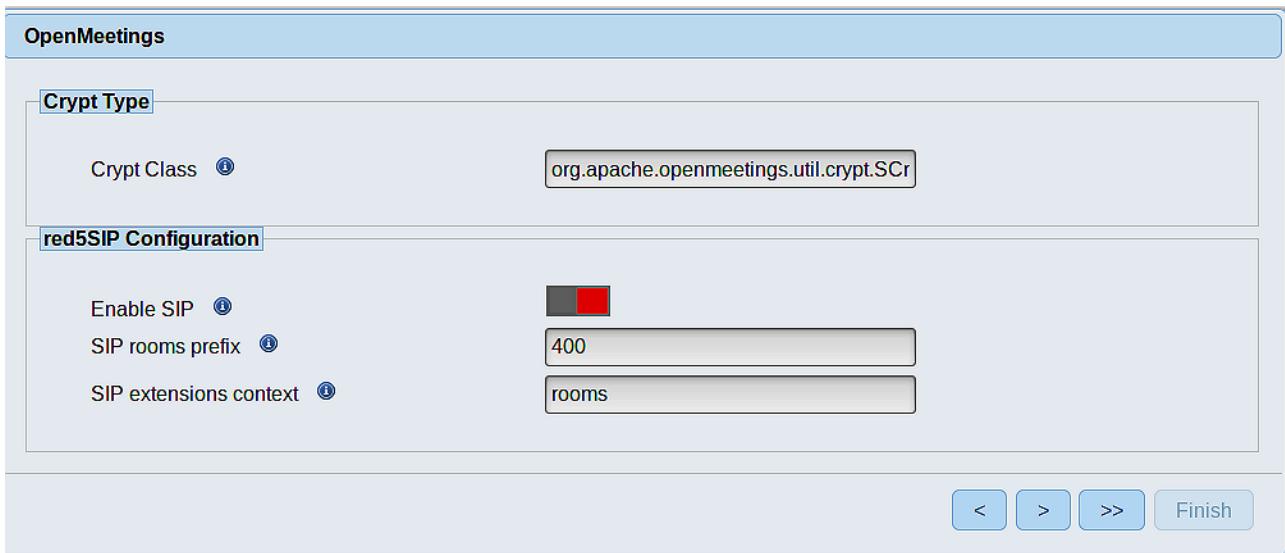

**FFMPEG Path** == /usr/local/bin

**SOX Path** == /usr/local/bin

**OpenOffice/LibreOffice Path for jodconverter** == /usr/lib/libreoffice (**32 - 64bits**)

As you go introducing paths, you can check if they are correct by pressing the button labeled **Check**. If it does not display any error message, that is OK.

Once completed the paths, please click the  button and move on to another page that would be to activate the SIP. We will leave it as is, unless you want to activate it knowing what it does:

Now push the button  Will show this window:

Push **Finish** button ...wait a seconds until the tables are fill in the database.

When has concluded, this another page will appear. **Don't** clic on [Enter the Application](#). First is need it to restart the server:

[/etc/init.d/red5-ubdeb2 restart](#)

The screenshot shows a web page with a blue header bar containing the text "OpenMeetings". Below the header, there is a large red warning message: "[Enter the Application](#)  
Database was changed, please restart application to avoid possible issues". Underneath this, there is a note: "If your Red5-Server runs on a different Port or on a different domain [alter the config values of the client](#)". Further down, there is a section titled "Mailing list" with a link: "<http://openmeetings.apache.org/mail-lists.html>". Below that, there is a section titled "There are some companies that also offer commercial support for Apache OpenMeetings:" with a link: "<http://openmeetings.apache.org/commercial-support.html>". At the bottom right of the page, there are four small buttons: '<', '>', '>>', and "Finish".

Now yes, you can clic on [Enter the Application](#), or go with your browser to:

<http://localhost:5080/openmeetings>

...and will take us to the entry of OpenMeetings:

The screenshot shows the "Login" page of the OpenMeetings application. It features a light blue header bar with the word "Login". Below the header, there are two input fields: "Username or mail address" and "Password". To the right of the password field is a checkbox labeled "Remember login". Below the input fields, there are two links: "Forgotten your password?" and "Network testing". At the bottom of the form, there are two buttons: "Not a member?" and "Sign in".

Introduce the user's name and the password that you have chosen during the installation, push the **Sign in** button and...

...**Congratulations!**

The next time that you like to accede to OpenMeetings will be:

<http://localhost:5080/openmeetings>

Remember to open in the server, the two following ports:

**1935    5080**

...in order that it could accede to OpenMeetings from other machines in Lan or from Internet.

**11)**

----- **OpenMeetings's configuration** -----

Once you acced to OpenMeetings, if you would like to do any modification in the configuration, please go to:

**Administration → Configuration**

The screenshot shows the OpenMeetings user profile interface. At the top, there is a navigation bar with four items: "Home", "Rooms", "Recordings", and "Administration". The "Administration" item in the top bar has a red arrow pointing up towards the "Administration" link in the top right corner of the main content area. The main content area includes a "Welcome" section with a user icon (a question mark inside a speech bubble) and a "Hello firstname lastname" greeting. It also displays the user's timezone as "Europe/Madrid", the number of unread messages as "0", and links to "Edit your profile" and "Upload new image". Below this, there is a "Help and support" section.

...and following the order of the red arrows:

The screenshot shows the Apache OpenMeetings administration interface. On the left is a table of system properties with columns for ID, Key, and Value. A row for 'path.ffmpeg' is selected and highlighted in blue. On the right is a detailed 'Configuration' dialog for this property. The dialog fields are: Type (string), Key (path.ffmpeg), Value (empty), Last update (Oct 17, 2017 5:54:57 PM), Updated by (toro), and Comment (Path To FFMPEG). Red arrows numbered 1, 2, and 3 indicate the sequence of steps: 1 points to the 'path.ffmpeg' entry in the table; 2 points to the 'Value' field in the dialog; and 3 points to the 'Key' field in the dialog.

ID	Key	Value
1	crypt.class.name	org.apache.openmeetings.util.crypt.SCryptImplementation
2	allow.frontend.register	true
3	allow.soap.register	true
4	allow.oauth.register	true
5	default.group.id	1
6	mail.smtp.server	localhost
7	mail.smtp.port	25
8	mail.smtp.system.email	noreply@openmeetings.apache.org
9	mail.smtp.user	
10	mail.smtp.pass	
11	mail.smtp.starttls.enabled	false
12	mail.smtp.connection.timeout	30000
13	mail.smtp.timeout	30000
14	application.name	OpenMeetings
15	default.lang.id	8
16	document.dpi	150
17	document.quality	90
18	path.imagemagick	
19	path.sox	
20	path.ffmpeg	
21	path.office	
22	dashboard.rss.feed1	http://mail-archives.apache.org/mod_mbox/openmeetings-user/?format=atom
23	dashboard.rss.feed2	http://mail-archives.apache.org/mod_mbox/openmeetings-dev/?format=atom
24	send.email.at.register	false
25	send.email.with.verification	false

And this is all.

If you have some doubt or question, please raise it in the Apache OpenMeetings forums:

<http://openmeetings.apache.org/mail-lists.html>

Thank you.

Alvaro Bustos
