Installation of Apache OpenMeetings 4.0.0 on openSUSE 13.2 32bit

This tutorial is made based on fresh installations of

openSUSE-13.2-GNOME-Live-i686.iso

It is tested with positive result. We will use the Apache's
binary version OpenMeetings 4.0.0 stable, that is to say
will suppress his compilation. It is done step by step.

5-11-2017

Starting…

1)

------ Update Operative System ------

Update operative system:

zypper refresh

zypper update

2)

------ Installation of Oracle Java 1.8 ------

Java **1.8** it is necessary to work OpenMeetings **4.0.0**. We install Oracle Java 1.8.

cd /opt

Download the file:

   (All in one line only. 1ª and 2ª without space between them. A space to the 3ª. Together 3ª and 4ª)

wget --no-cookies --no-check-certificate --header "Cookie: gpw_e24=http%3A%2F
%2Fwww.oracle.com%2F; oraclelicense=accept-securebackup-cookie"
http://download.oracle.com/otn-pub/java/jdk/8u152-b16/aa0333dd3019491ca4f6ddbe78cdb6d0/jdk-
8u152-linux-i586.rpm

...and install it:

rpm -ivh jdk-8u152-linux-i586.rpm

zypper install update-alternatives

We do to Oracle, the default java system:

update-alternatives --install /usr/bin/java java /usr/java/jdk1.8.0_152/bin/java 1551

update-alternatives --install /usr/bin/javadoc javadoc /usr/java/jdk1.8.0_152/bin/javadoc 1551

update-alternatives --install /usr/bin/jar jar /usr/java/jdk1.8.0_152/bin/jar 1551

update-alternatives --install /usr/bin/javap javap /usr/java/jdk1.8.0_152/bin/javap 1551

update-alternatives --install /usr/bin/javac javac /usr/java/jdk1.8.0_152/bin/javac 1551

update-alternatives --install /usr/bin/javah javah /usr/java/jdk1.8.0_152/bin/javah 1551

update-alternatives --install /usr/bin/jarsigner jarsigner /usr/java/jdk1.8.0_152/bin/jarsigner 1551

Maybe you have installed different versions of Java. We select the just installed Oracle Java:

update-alternatives --config java

And to see if the selected version is active:

java -version

3)

------ Installation of LibreOffice ------

OpenMeetings need LibreOffice to convert to pdf the uploaded office files.

Maybe it is installed, but for iso server:

zypper install -y libreoffice

4)

------ Installation of necessary packages and libraries ------

We install packages and libraries that need later:

(Only one line with space between both)

zypper install -y gcc ghostscript unzip freetype freetype-devel ncurses ncurses-devel make libz1
zlib-devel libtool bzip2 file-roller git autoconf automake pkg-config nmap nano

5)

------ Installation ImageMagick and Sox ------

ImageMagick, will work with images files jpg, gif, png, etc. We install it and some librarie:

zypper install -y ImageMagick giflib-devel

Sox, work the sound. Will compile it, ´cause it is newer version than the repos:

cd /opt

wget http://sourceforge.net/projects/sox/files/sox/14.4.2/sox-14.4.2.tar.gz

tar xzvf sox-14.4.2.tar.gz

cd /opt/sox-14.4.2

./configure

make && make install

6)

------ Installation of Adobe Flash Player ------

OpenMeetings even need Adobe Flash Player for cam. It find in the repos.
We install it:

zypper install -y flash-player

7)

------ Compilation of FFmpeg ------

FFmpeg work video. We´ll compile it. Now install paquets and libraries.

zypper install -y glibc imlib2 imlib2-devel mercurial cmake

zypper install -y freetype2-devel libfreetype6 curl git

zypper install -y libogg-devel libtheora-devel libvorbis-devel libvpx-devel

This ffmpeg compilation is based on this url, updated file versions 5-11-2017:

https://trac.ffmpeg.org/wiki/CompilationGuide/Centos

I made a script that will download, compile and install ffmpeg.
The result of any recording we do in OpenMeetings, will be in mp4 format.

Download the script:

cd /opt

(Only one line without space between both)

wget https://cwiki.apache.org/confluence/download/attachments/27838216/ffmpeg-opensuse132-32bit.sh

...concede execution permission:

chmod +x ffmpeg-opensuse132-32bit.sh

...and run it (be connected to Internet):

./ffmpeg-opensuse132-32bit.sh

Will spend about 20-30 minutes. When is finished, will announce it:

FFMPEG Compilation is Finished!

Then, please go to **step 8)**.

But, if you prefer copy and paste, i **don´t advise,** here are the commands script:

nano /opt/ffmpeg-opensuse.sh

...copy the green text **from here**:

```
# FFmpeg compilation for openSUSE 13.2, 32 bit only.
# Alvaro Bustos, thanks to Hunter.
# 5-11-2017
# Install libraries

zypper install -y autoconf automake cmake freetype-devel gcc gcc-c++ git libtool make mercurial
nasm pkgconfig zlib-devel

# Install yasm from repos
zypper install -y yasm

# Create a temporary directory for sources.
SOURCES=$(mkdir ~/ffmpeg_sources)
cd ~/ffmpeg_sources

# Download the necessary sources.
#git clone --depth 1 git://git.videolan.org/x264
curl -#LO ftp://ftp.videolan.org/pub/x264/snapshots/last_stable_x264.tar.bz2
hg clone https://bitbucket.org/multicoreware/x265
git clone --depth 1 git://git.code.sf.net/p/opencore-amr/fdk-aac
curl -L -O http://downloads.sourceforge.net/project/lame/lame/3.99/lame-3.99.5.tar.gz
wget https://sources.voidlinux.eu/opus-1.2.1/opus-1.2.1.tar.gz
wget http://downloads.xiph.org/releases/ogg/libogg-1.3.2.tar.gz
wget http://downloads.xiph.org/releases/vorbis/libvorbis-1.3.5.tar.gz
wget http://downloads.xiph.org/releases/theora/libtheora-1.1.1.tar.gz
git clone --depth 1 https://chromium.googlesource.com/webm/libvpx.git
# git clone --depth 1 git://source.ffmpeg.org/ffmpeg
wget http://ffmpeg.org/releases/ffmpeg-3.1.1.tar.gz

# Unpack files
for file in `ls ~/ffmpeg_sources/*.tar.*`; do
tar -xvf $file
done

cd x264-*/
./configure --prefix="$HOME/ffmpeg_build" --bindir="$HOME/bin" --enable-static && make &&
make install && make distclean; cd ..
```

```
cd x265/build/linux
cmake -G "Unix Makefiles" -DCMAKE_INSTALL_PREFIX="$HOME/ffmpeg_build"
-DENABLE_SHARED:bool=off ../../source && make && make install; cd ~/ffmpeg_sources

cd fdk-aac
autoreconf -fiv && ./configure --prefix="$HOME/ffmpeg_build" --disable-shared && make &&
make install && make distclean; cd ..

cd lame-*/
./configure --prefix="$HOME/ffmpeg_build" --bindir="$HOME/bin" --disable-shared --enable-
nasm && make && make install && make distclean; cd ..

cd opus-*/
autoreconf -fiv && ./configure --prefix="$HOME/ffmpeg_build" --disable-shared && make &&
make install && make distclean; cd ..

cd libogg-*/
./configure --prefix="$HOME/ffmpeg_build" --disable-shared && make && make install &&
make distclean; cd ..

cd libvorbis-*/
LDFLAGS="-L$HOME/ffmeg_build/lib64" CPPFLAGS="-I$HOME/ffmpeg_build/include"
./configure --prefix="$HOME/ffmpeg_build" --with-ogg="$HOME/ffmpeg_build" --disable-shared
&& make && make install && make distclean; cd ..

cd libtheora-*/
./configure --prefix="$HOME/ffmpeg_build" --with-ogg="$HOME/ffmpeg_build" --disable-
examples --disable-shared --disable-sdltest --disable-vorbistest && make && make install; cd ..

cd libvpx
./configure --prefix="$HOME/ffmpeg_build" --disable-examples && make && make install &&
make clean; cd ..

cd ffmpeg-*/

PKG_CONFIG_PATH="$HOME/ffmpeg_build/lib/pkgconfig" ./configure
--prefix="$HOME/ffmpeg_build"  --extra-cflags="-I$HOME/ffmpeg_build/include" --extra-
ldflags="-L$HOME/ffmpeg_build/lib" --bindir="$HOME/bin" --pkg-config-flags="--static"
--enable-gpl --enable-nonfree --enable-libfdk_aac --enable-libfreetype --enable-libmp3lame
--enable-libopus --enable-libvorbis --enable-libvpx --enable-libx264 --enable-libx265 --enable-
libtheora && make && make install && make distclean && hash -r; cd ..

cd ~/bin
cp ffmpeg ffprobe ffserver lame x264 /usr/local/bin

cd ~/ffmpeg_build/bin
cp x265 /usr/local/bin

echo "FFMPEG Compilation is Finished!"
```

...**to here.**

Concede permission of execution:

chmod +x /opt/ffpmeg-opensuse.sh

cd /opt

Now be connected to Internet, run the script and wait some long minutes while the compilation:

./ffmpeg-opensuse.sh

All the compiled files will be installed in: /usr/local/bin

8)
------ Installation of MariaDB data server ------

MariaDB is the data server.

We install it:

zypper install -y mariadb mariadb-tools

...and run MariaDB:

systemctl start mysql.service

Give a password to mariadb root . Please, modify new-password by your own:

mysqladmin -u root password new-password

Make a database with his own user for OpenMeetings:

mysql -u root -p

...will ask for the mariadb root password you does just now:

  MariaDB [(none)]> CREATE DATABASE open40 DEFAULT CHARACTER SET 'utf8';

With this command we has created a database called open40.
Now we create a user with all permission on this database. User password must be of 8 digits minimum:

(Only one line with space between both)

MariaDB [(none)]> GRANT ALL PRIVILEGES ON open40.* TO 'hola'@'localhost' IDENTIFIED BY '1a2B3c4D' WITH GRANT OPTION;

* open40 ......is the database name.
* hola ………is the user name for the database.
* 1a2B3c4D ..is the password of this user.

You can change the data...but remember it! Later we´ll need it.
Now, we leave MariaDB:

MariaDB [(none)]> quit

9)

------ Installation of OpenMeetings ------

We´ll install OpenMeetings in /opt/red540. All the following information will be based on this directory.

Make the folder:

mkdir /opt/red540

cd /opt/red540

...and download the OpenMeetings file:

wget http://apache.miloslavbrada.cz/openmeetings/4.0.0/bin/apache-openmeetings-4.0.0.zip

unzip apache-openmeetings-4.0.0.zip

...save the unloaded file to /opt:

mv apache-openmeetings-4.0.0.zip /opt

Download and install the file connector between OpenMeetings and MariaDB:

cd /opt

(Only one line without space between both)

wget http://repo1.maven.org/maven2/mysql/mysql-connector-java/5.1.42/mysql-connector-java-5.1.42.jar

...and copy it to where must be:

cp /opt/mysql-connector-java-5.1.42.jar /opt/red540/webapps/openmeetings/WEB-INF/lib

Now we are going to configure OpenMeetings for our database in MariaDB:

nano /opt/red540/webapps/openmeetings/WEB-INF/classes/META-INF/mysql_persistence.xml

Modify in line 72:

, Url=jdbc:mysql://localhost:3306/openmeetings?

...to

, Url=jdbc:mysql://localhost:3306/open40?

...it is the name of the database that we did initially.

Logically if initially you choose another name for the database, you will type it here.

Push **Ctrl+x**, **Y** and **Enter** in the keyboard, to save and leave nano.

We protect the access to the file:

(Only one line without space between both)

chmod 640 /opt/red540/webapps/openmeetings/WEB-INF/classes/META-INF/mysql_persistence.xml

10)
------ Script to launch red5-OpenMeetings ------

Please, download the red5 run script:

cd /opt

 wget https://cwiki.apache.org/confluence/download/attachments/27838216/red5-2

...copy it to:

cp red5-2 /etc/init.d/

...concede permission of execution:

chmod +x /etc/init.d/red5-2

If you made the installation in any other path, please, edit the script and modify the line:

RED5_HOME=/opt/red540

...to

RED5_HOME=/your-path-installation

11)

------ Run red5-OpenMeetings ------

Restart MariaDB (be connected to Internet):

systemctl restart mysql.service

...and run red5-OpenMeetings. Please, in a new terminal and connected to Internet:

/etc/init.d/red5-2 start

...wait till, at the last, show this text: "**CleanupJob.cleanRoomFiles".** After this, please, go to:

http://localhost:5080/openmeetings/install

...there will appear a page similar to this one:
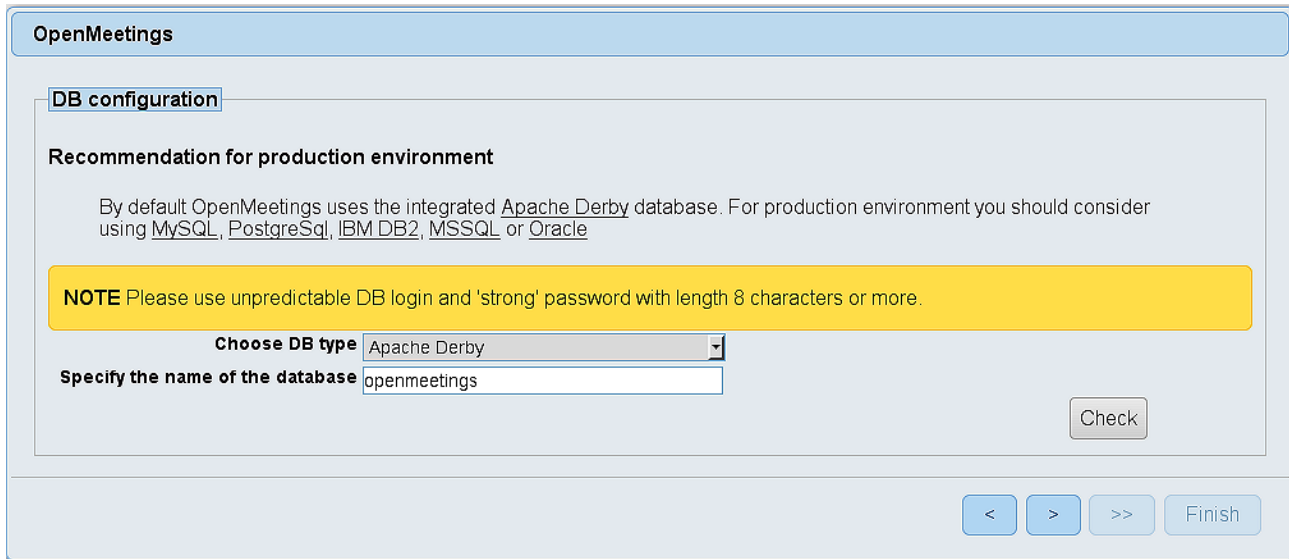

...press on `>` (bottom), and will show the default configuration with Derby, but we employ

MySQL (MariaDB):
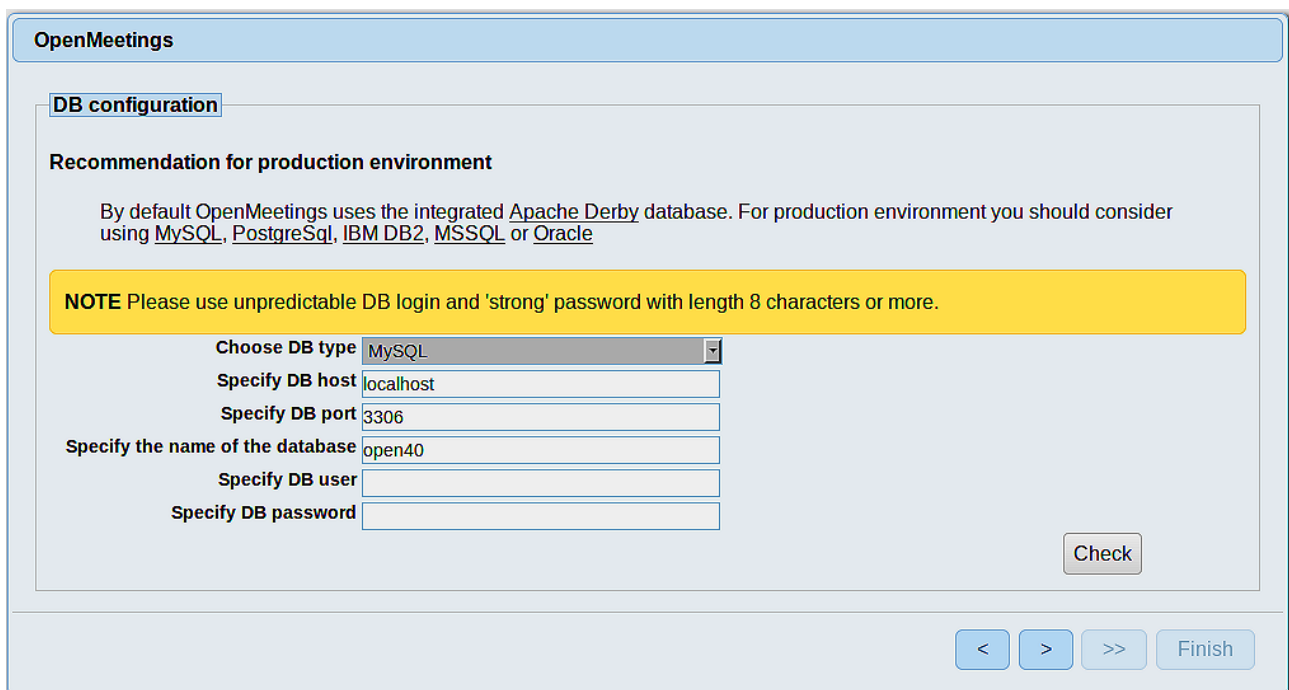

...so, scroll and **Choose DB type** to MySQL:

...and will show the database configuration we made in step 9.
If you`ve choose any other different name for this, will show equally.

Now we must introduce the user name we did for our data base, at the step 8, and his password:

Specify DB user   =   hola

Specify DB password   =   1a2B3c4D

...if you choose any other data, here is where to type it.

Please, press   `>`   button, and will go to:

Here, we must introduce a user name for OpenMeetings, and his password. This must have 8 digits minimum, and at least 1 special symbol like: + (% # !   ...etc.

Username   =   a-name   ...this user will be administrator.

Userpass   =   a-password ...for the previous user.

Email   =   email-adress ...of the previous user.

User Time Zone   =   country where is this server.

Name   =   example-openmeetings ...group name to choose.

Press the button   `>`   and will lead us to a new page (below) where you can select the language for your OpenMeetings server, as well as other options such as the configuration of the mail server being used to send invitations or meetings from OpenMeetings:

A valid example to configure the mail server with Gmail, is as follows:
(replace **john@gmail.com** with your real Gmail account)

|		
Mail-Refer	==	john@gmail.com
SMTP-Server	==	smtp.gmail.com
SMTP-Server Port (default Smtp-Server Port is 25)	==	587
SMTP-Username	==	john@gmail.com
SMTP-Userpass	==	password of john@gmail.com
Enable TLS in Mail Server Auth	==	...turn green the button to activate

To select the language of your server OpenMeetings, please scroll on the line:

Default Language	==	...select your language

...the rest you can change it as you like.

Now press the button   > and a new page will appear:

OpenMeetings

Converters

Document conversion DPI ⓘ   150

Document conversion JPEG Quality ⓘ   90

ImageMagick Path ⓘ   Check

FFMPEG Path ⓘ   Check

SoX Path ⓘ   Check

OpenOffice/LibreOffice Path for jodconverter ⓘ   Check

see also *Installation*

< | > | >> | Finish

Here we´ll introduce the respective paths for the image, video, audio and conversion of uploaded files:
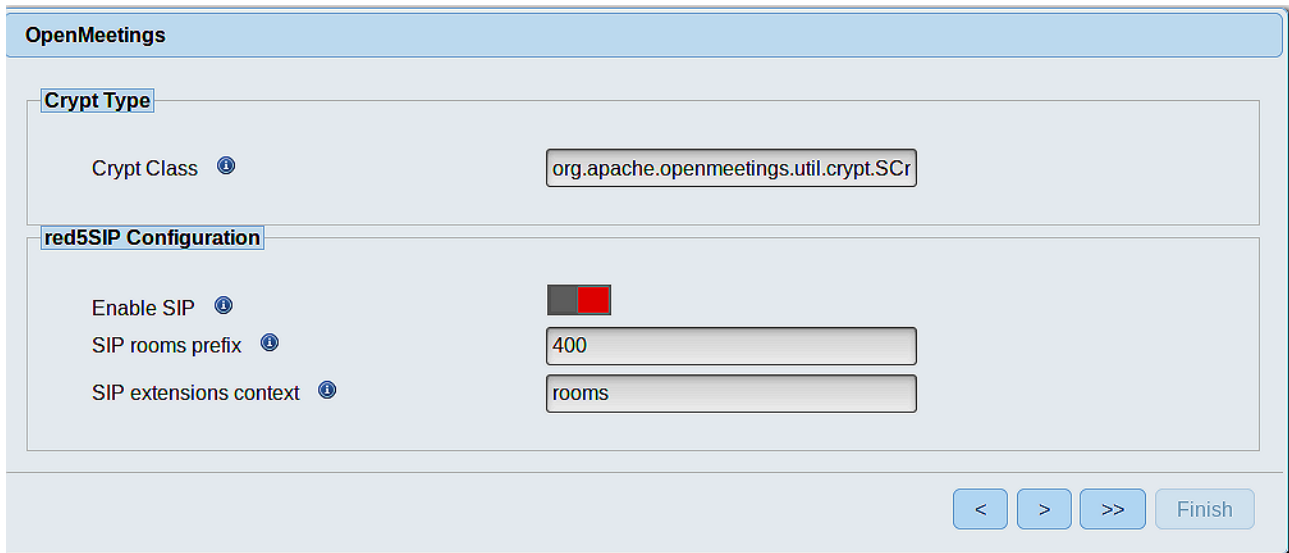

ImageMagick Path (Path) == /usr/bin

FFMPEG Path (Path)   == /usr/local/bin

SOX Path (Path)   == /usr/local/bin

OpenOffice/LibreOffice Path (Path) for jodconverter   == /usr/lib/libreoffice

As you go introducing paths, you can check if they are correct by pressing the button labeled **Check**. If it does not display any error message, that is OK.

Once completed the paths, please click the [>] button and move on to another page that would be to activate the SIP. We will leave it as is, unless you want to activate it knowing what it does:

OpenMeetings

Crypt Type

Crypt Class ⓘ   org.apache.openmeetings.util.crypt.SCr

red5SIP Configuration

Enable SIP ⓘ

SIP rooms prefix ⓘ   400

SIP extensions context ⓘ   rooms

[<] [>] [>>] [Finish]

Now press the button [>] Will show this window:

OpenMeetings

Please click "Finish" button to start installation!

[<] [>] [>>] [Finish]

Press **Finish** button...wait a seconds untill the tables are fill in the database.

When has concluded, this another page will appear. Don´t clic on **Enter the Application**. First is need it restart the server. Please, open a new terminal and restart red5, connected to Internet:

/etc/init.d/red5-2 restart

OpenMeetings

Enter the Application

Database was changed, please restart application to avoid possible issues

If your Red5-Server runs on a different Port or on a different domain
alter the config values of the client

Mailing list

http://openmeetings.apache.org/mail-lists.html

There are some companies that also offer commercial support for Apache OpenMeetings:

http://openmeetings.apache.org/commercial-support.html

< > >> Finish

Now yes, you can clic on **Enter the Application**, or go with your browser to:

http://localhost:5080/openmeetings

...and will take us to the entry of OpenMeetings:

Login

Username or mail address

Password

☐ Remember login

Forgotten your password?   Network testing

Not a member?   Sign in

Introduce the user's name and the password that you have choosen during the installation, push
Sign in button and...

...**Congratulations!**

The next time that you like to accede OpenMeetings, would be:

http://localhost:5080/openmeetings

Remember to open in the server, the two following ports:
1935   5080

...in order that it could accede to OpenMeetings from other machines in Lan or Internet.

12)

------- OpenMeetings's configuration -------

Once you acced to OpenMeetings, if you would like to do any modification in the configuration, please go to:

Administration → Configuration

...and following the order of the red arrows:

| | Home ▾ | Rooms ▾ | Recordings ▾ | Administration ▾ | | | |
