- Srinath Perera, WSO2
- Supun Nakandala, IU
- Suresh Marru (Chair), IU
- Thilina Gunarathne, KPMG
- Viknes Balasubramanee, PernixData

# Airavata Overview

---

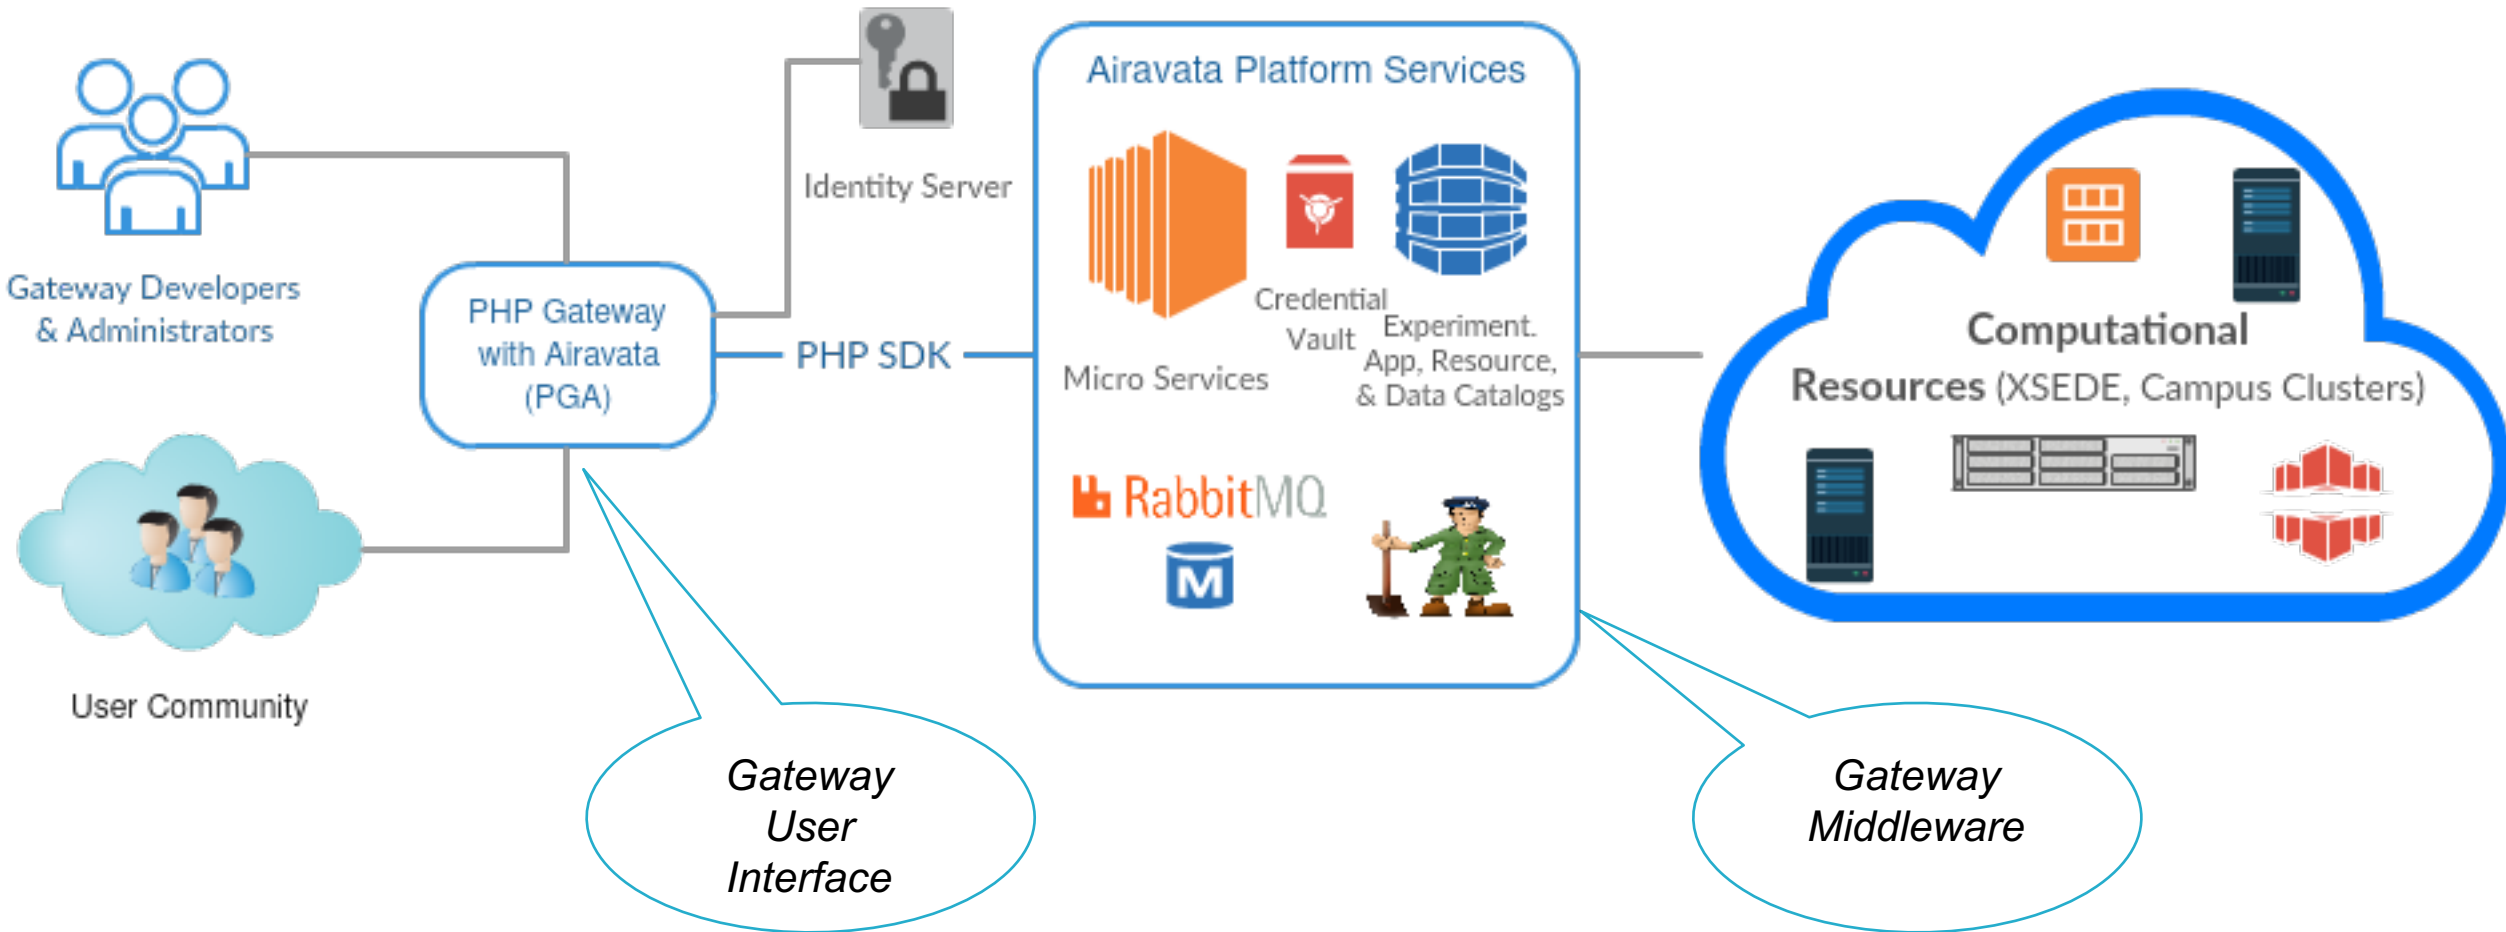

- Airavata is a general purpose **distributed task management system** build on **micro-service** and component based architecture principles.
- Airavata provides capabilities to compose, manage, **execute** and **monitor** large scale **applications** on distributed computing resources.
- Airavata supports executions on **local clusters, national grids, academic and commercial clouds**.
- Airavata is **multi-tenanted** -- one service runs many gateways.

# Airavata: Keep it simple, yet flexible

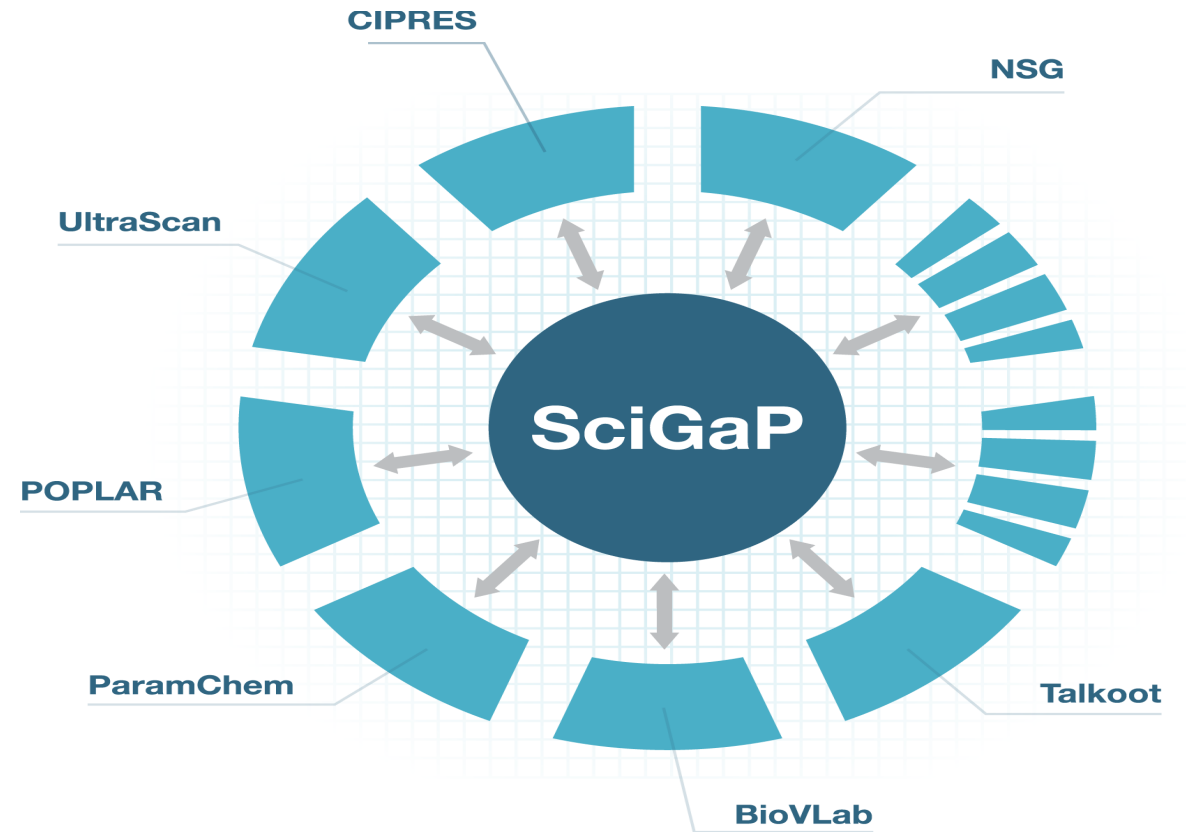

- External clients interact with Airavata API (based on Apache Thrift).
- Internally, components interact with each other through Component Programming Interfaces (thrift based CPIs).

# Gateway Anatomy mapped to Airavata

# SciGaP Key Mission

*Scale number of gateways without having to scale FTE's needed to support them.*

## Experiments Created by the hour of the day

```
In [21]: df['hour_of_day'] = df['Creation Time'].apply(lambda time: datetime.utcnow().timestamp(time/1000).hour)
```

```
In [29]: df['hour_of_day'].value_counts().sort_index().plot('bar')
```

Out[29]: <matplotlib.axes.\_subplots.AxesSubplot at 0xa192198>

```
In [39]: slices= [ls5_cn,stampede_cn,comet_cn,gordon_cn,alamo_cn]
cols = ['c','m','r','w','y']
Hosts= ["lonestar","stampede","comet","gordon" , "alamo"]
plt.pie(slices,
        labels= Hosts,
        colors=cols,
        startangle=90,
        shadow= False,
        autopct='%1.1f%%')
```

```
plt.title('Percentage Use by Resources')
plt.show()
```

Percentage Use by Resources

# Tutorial Modules

---

1. Module 1 - Introductions & Warmup
2. Module 2 - Test-Drive Airavata
3. Module 3 - Under the Hood Technical Details
4. Module 4 - Build your own Gateway
5. Module 5 - Interactive Web Notebooks + Airavata
6. Module 6 - Data Organization, Sharing, Discovery
7. Module 7 - Conclude & Getting support

# GSoC Project: Inspect executions through layers

Traditional long-running applications run on remote computing resources and provide minimal information to the user during execution.

Start Application

1) Run Computation

Remote Compute Node

Using WebSockets and AMQP, the PGA will allow users to view application logs and intermediate results as they are generated on remote computing resources.

End Application

3) Stream Intermediate Result to User

2) Record Intermediate Result
