**Proposal #1: Redirection of selected content**
- Requires deciding which selected content will be migrated.
- Only some selected content will redirect (301).
- Non selected content will return 404.
- Oracle job: add redirections from selected content (.htaccess file or similar)

https://netbeans.org/whatever/non-selected.html

HTTP/301 – Moved permanently

HTTP/404

https://netbeans.org/kb/docs/java/quickstart.html

HTTP/301 – Moved permanently

https://netbeans.apache.org/kb/docs/java/quickstart.html

https://netbeans.org

https://netbeans.apache.org

Proposal #2: Using a "legacy.netbeans.org" site
- Everything will redirect (301).
- Non selected content will generate a 404, which will redirect to legacy.netbeans.org.
- Oracle job: new website, clone of https://netbeans.org with all links changed to legacy.netbeans.org .
- Apache job: add .htaccess redirections (or similar) to legacy.netbeans.org

https://netbeans.org/whatever/non-selected.html

HTTP/301 – Moved permanently

HTTP/404 – Not Found

https://legacy.netbeans.apache.org/whatever/non-selected.html

https://netbeans.org/kb/docs/java/quickstart.html

HTTP/301 – Moved permanently

https://netbeans.apache.org/kb/docs/java/quickstart.html

https://netbeans.org

https://netbeans.apache.org

https://legacy.netbeans.org

Other issues that require planning:
- Enumerate and plan list of domains to migrate (each will require specific planning): hg.netbeans.org, bits.netbeans.org, plugins.netbeans.org, users.netbeans.org, any others?.
- Hosting third-party binaries for builds (including non APLv2 binaries).
